

Math 2C03: Quiz #2

MONDAY, JULY 6TH, 7PM (FIRST 10 MINUTES OF CLASS)
McMaster University

Name: *marking scheme* Student ID: _____

Please answer each question fully, providing all reasoning

Questions:

- In class last Monday we discussed three types of differential equations: homogeneous, Bernoulli's equation, and DE's of the form $y' = f(Ax + By + C)$, for $A, B, C \in \mathbb{R}$, $B \neq 0$. These equations can all be solved by making an appropriate substitution which transforms them into a separable or linear equation.
 - (3pts) Define each type of equation.
 - (3pts) In each case, what substitution should be made to solve it?
 - (3pts) For each, which type of equation does the differential equation become after making that substitution?
 - (3pts) Give an example of each type of equation.

(1pt) $\left\{ \begin{array}{l} \text{A 1st-order DE } M(x,y)dx + N(x,y)dy = 0 \text{ is homogeneous if } M \text{ \& } N \\ \text{are homogeneous functions of the same degree. i.e. } M(tx,ty) = t^k M(x,y) \\ \text{\& } N(tx,ty) = t^k N(x,y) \text{ for some } k \in \mathbb{R}. \end{array} \right.$

(1pt) $\left\{ \begin{array}{l} \text{Bernoulli's eqn is a DE of the form } y' + P(x)y = F(x)y^n. \end{array} \right.$

(1pt) $\left\{ \begin{array}{l} y' = F(Ax + By + C) \text{ is a 1st-order DE } y' = g(x,y), \text{ where} \\ g(x,y) \text{ can be written as a function of } u = Ax + By + C. \end{array} \right.$

\rightarrow [For this one, the name $y' = F(Ax + By + C)$ is kind of self-explanatory... so even if they say it's a DE of the form $y' = F(Ax + By + C)$, that would be fine.]

(1pt) $\left\{ \begin{array}{l} \text{i} \text{ Make the substitution } y = ux \text{ or } x = vy. \end{array} \right.$

(1pt) $\left\{ \begin{array}{l} \text{ii} \text{ } u = y^{1-n} \end{array} \right.$

(1pt) $\left\{ \begin{array}{l} \text{iii} \text{ } u = Ax + By + C \end{array} \right.$

⊙ (1pt) 1 → separable

(1pt) 2 → linear

(1pt) 3 → separable

⊙ (1pt) 1 $\frac{dy}{dx} = \frac{x^2 - y^2}{3xy} \Leftrightarrow 3xy dy + (-x^2 + y^2) dx$ homog. of degree 2.

(1pt) 2 $y' - 5y = -\frac{5}{2} xy^3$ Bernoulli's eqⁿ, with $n=3$.

(1pt) 3 $y' = (-2x + y)^2 - 7$ has the form $y' = F(Ax + By + c)$, where $A = -2, B = 1, c = 0$.

* any examples that work are fine here.*

⊙ (1pt) 1 $y' = F(Ax + By + c)$ is a DE where the RHS is a function of $Ax + By + c$.
⊙ (1pt) 2 Bernoulli's eqⁿ is a DE of the form $y' + P(x)y = Q(x)y^n$.
⊙ (1pt) 3 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 4 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 5 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 6 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 7 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 8 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 9 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
⊙ (1pt) 10 For the form $y' = F(Ax + By + c)$, the RHS is a function of $Ax + By + c$.
